	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Create a Java-based interface that allows users to enter grading components and their percentage weights. ● Allow users to enter scores for completed assessments and identify which assessments remain ungraded. ● Calculate the student's current weighted grade based on completed assessments. ● Allow users to enter hypothetical scores for remaining assessments to calculate their projected final grade. ● Calculate the average score needed across remaining assessments to reach a desired final grade, including identifying when a target is mathematically impossible.	**Schedule - (For V2.0+)** ● Save and load course grading information using local files so users don't need to reenter their data ● Support multiple courses and allow users to switch between them. ● Allow users to track individual assignments within grading categories rather than entering only overall scores. ● Add customizable letter-grade thresholds to display predicted letter grades alongside numerical percentages.
Not Important	**Delegate - (Use a library)** ● Use Java's built-in Scanner class to handle user input instead of creating a custom input system. ● Use Java's ArrayList collection to store grading components and scores instead of building a custom data structure. ● Use Java's built-in printf() formatting to display grade percentages and calculation results clearly instead of implementing custom formatting logic.	**Delete - (Cut it)** ● Develop a dedicated mobile application for Android or iOS. ● Integrate directly with Purdue Brightspace to automatically retrieve assignment grades. ● Implement AI or machine learning to predict future student performance. ● Add user accounts and online authentication. ● Build a complex dashboard with interactive charts and animations.
